

Alphazed Trading View Indicator

An advanced indicator & strategy supporting Alarms, automated Buy & Sell + TP/SL Triggers

This Expert Advisor is trained on Gold, ideally to track swing trading on the daily chart. It also supports smaller time frames and allows user modification of parameters to adapt to any chart, stock, commodity, or forex trading pair.

This indicator is based on Fractal Recognition and Wave Analysis algorithms, using back tested and proven trading strategies. The developer literally made over 141+ different versions and revisions to this algorithm during the process of training, and subscribers receive all updates for a lifetime. Alphazed combines logic from multiple indicators and analysis systems, to give you market direction, trend, as well as the best entries & exits for hassle free trades.

Engineered as a set it and forget it system, Alphazed is meant to be used with trailing stop loss to ensure gains are preserved. Additionally, users will get better results by having a lower latency or PING to their respective brokerage or exchange service.

Price ~~\$100~~ \$50 monthly

Yearly ~~\$1,000~~ \$420 yearly

with unlimited updates to the trading view indicator.

Section 1: Double Peak Essentials

In the chart below, we see that the market moves in a wave-like motion, producing peaks and valleys.

The difficult part of analysis is to determine the wave's inflection points and changes in trend.

ESSENTIALS

Adding the Alphazed Indicator will allow us to identify a top or a bottom in the market.

The Alphazed Indicator will filter the noise...

Here we have the Alphazed Indicator on the chart. The Alphazed Indicator consists of two lines. Confirmed Tops and Bottoms are established when these two lines converge at the same price point:

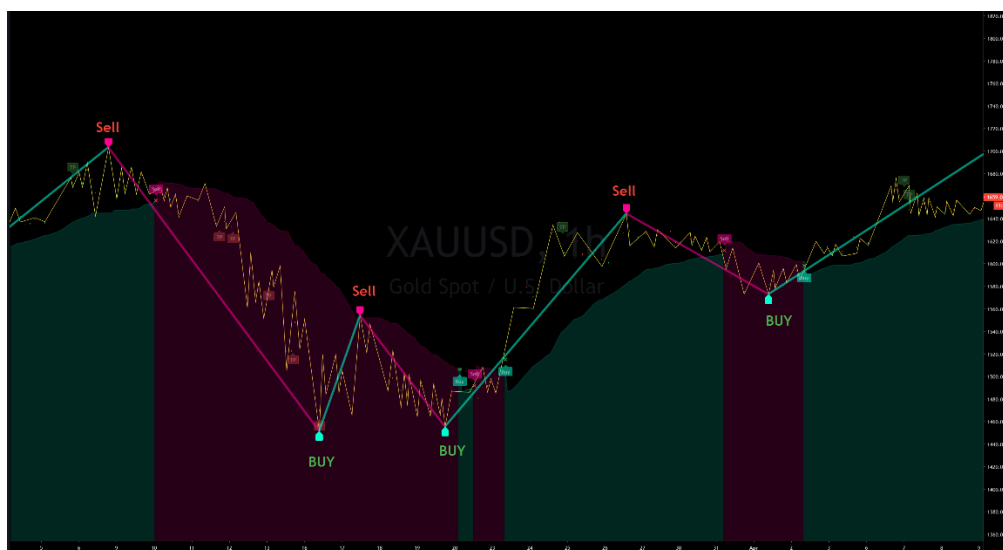

ESSENTIALS

The Double Peak Lines will mark the points on the chart whenever price moves in the opposite direction by a percentage greater than a certain variable.

The Double peak Lines will mark the points on the chart whenever price moves in the opposite direction by a percentage greater than a certain variable.

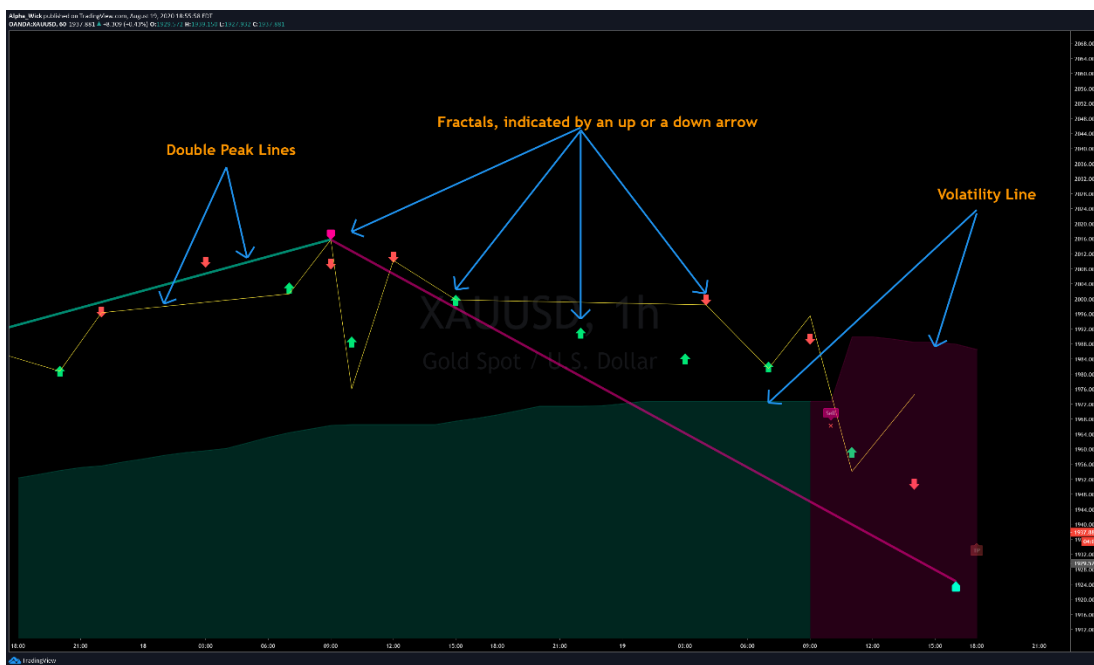

Section 2: The Indicator Set

Alphazed Indicator Set

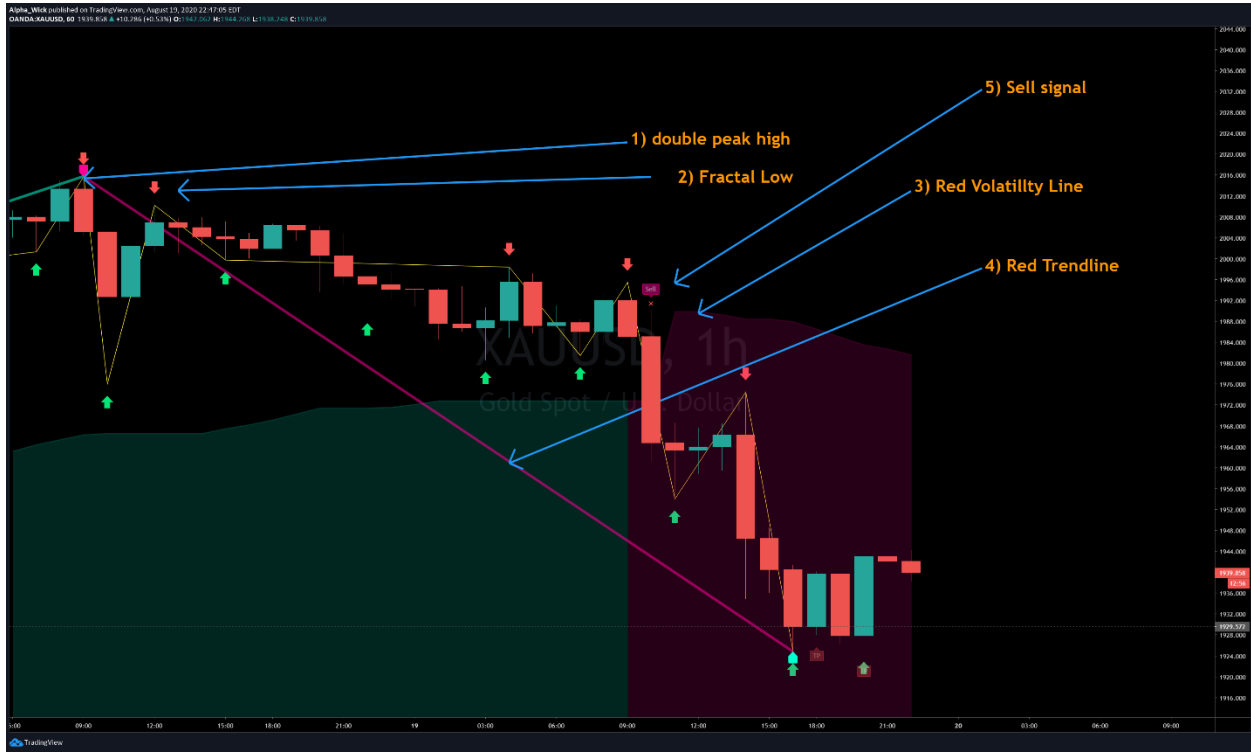

THE INDICATOR SET

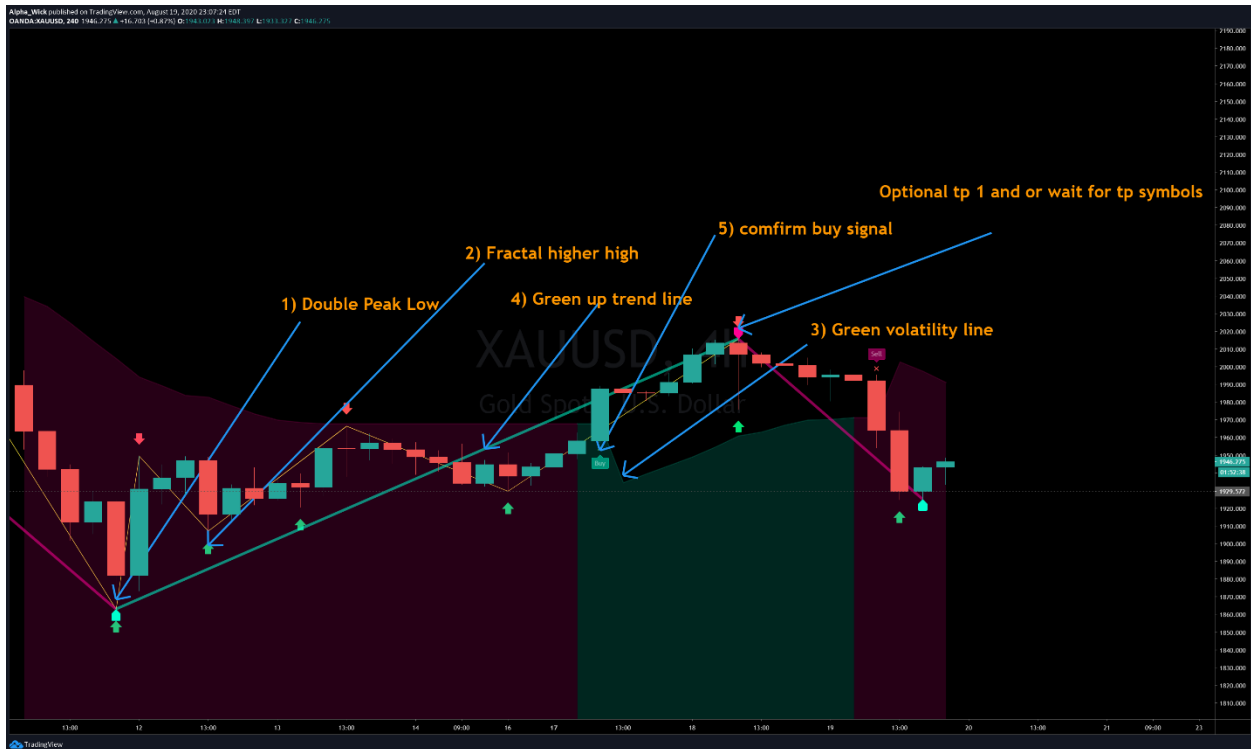

The Volatility lines show the market trend and bullish or bearish pressure.

Section 4: Money Management

You need to protect your money, it's that simple. Calculate the risk of your trade. It is recommended no more than 0.5% risk per trade. Therefore, it is wise to avoid aggressive trading by lowering exposure. A small sequence of losses could be disastrous.

Set realistic goals and trade conservatively. It is recommended a goal of 3% per month. If you can trade successfully for three months, then you can decide to become more aggressive.

Admit when you are wrong. We do not have crystal balls. If the probability or trend has changed then there is no reason to get married to the trade. Alphazed will show you the new trade. Sometimes buyers are finnick and you get a buy sell buy sell. The last sell tanks. Or you get a sell buy sell buy into a bull run. The indicator is set up to catch these inflection points and have you in the most reliable, profitable trade.

Use a trailing stop to preserve gains, and for example if you trade BTCUSD, use the TPs to trigger the trailing stop and every tp after to set a tighter trailing step to preserve as much gain as safely as possible.

Never trade without a stop loss. Do not underestimate the chances of price shocks, such as central bank announcements, political events, major world news events, etc.

Section 5: Risk Management

You need to protect your money, it's that simple. • Calculate the risk of your trade. I recommend no more than 0.5% risk per trade. Therefore, it is wise to avoid aggressive trading by lowering exposure. A small sequence of losses could be disastrous.

Rule of thumb: Do not trade more than 2% of your total account balance in any given trade, whatsoever.

Section 6: Trading Psychology

Why do traders lose money?

- ***They don't cut their losing trades fast enough.***
- ***They try to guess the market turning points instead of going in the direction of highest probability.***
- ***They ignore the trend, the current, the stream, like shorting Bitcoin, or any other appreciative asset, after the step function hits a new (higher) floor price.***
- ***They don't have a strategy/plan and do not stick to that plan. Plan your trade and "trade that plan".***
- ***They trade with their EMOTIONS, not with their brains. Some traders will become emotional after experiencing 5 consecutive losing trades and then "revenge trade" thereby risking more money to make up for a bad day.***

You do not have to be anxious about trading. Try to eliminate anxiety by taking your time. There is no need to jump into a trade immediately.

Stop trading for the day when you made 1% profit and try to do a different activity other than trading. Stop trading for the day if you are stopped out. Tomorrow is another day.

You need to accept the fact that the market will not immediately move in your favor.

Just like any other business, profits will be gained by consistent, small gains. There is no such thing as making a "killing".
